# Lab 1 – MATH 240 – Computational Statistics

First Author Affiliation Department email@domain

#### Abstract

This document provides a basic template for the 2-page labs we will complete each week. Here, you should provide a succinct summary about what you did and why it might be helpful.

**Keywords:** What topics does the lab cover with respect to class?

## 1 Instructions

For this lab, you will

- 1. Install R and RStudio.
- Install tinytex (if necessary): install.packages("tinytex")
- 3. Create a Git Hub account  $\ensuremath{\mathsf{here}},$  and email me your username
- 4. Install GitHub desktop.
- 5. Accept the LAB 1 assignment here.
- 6. Recreate this document (except put your name/info at the top) to get used to writing in LATEX and to see the types of things we can do when creating a document to convey statistical information. Make sure to commit and push your work using GitHub desktop as you finish each section.

**Remark:** You will find the class Sweave cheatsheet to be incredibly (*incredibly*) helpful.

# 2 Word Processing Tasks

## 2.1 Centering Text

We can center text in Sweave.

## 2.2 Bold, Italics, and Underlining

We can **bold**, *italicize*, <u>underline</u>, and emphasize text in Sweave.

Note, I did a column break here so that the list wasn't broken across columns.

# 2.3 Lists, and Numbered Lists

We can write an unordered list in Sweave.

- first item
- second item
- third item

We can write a numbered list in Sweave.

- 1. first item
- 2. second item
- 3. third item

We can write a lettered list in Sweave.

- a. first item
- b. second item
- c. third item

### 2.4 Submissions

This part of the midterm is due Sunday November 14 by 5p. I will not accept late submissions. Note that you may use this template to help build your introduction and methods sections, and you can use the work you did as a group during the datathon. Still, I expect this submission to be your own summary and extension of that work without collaboration.

# 2.5 Typing Mathematical Equations

We can write a one line equation that is centered like this

$$\widehat{y_i} = \beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \beta_3 x_{1i} x_{2i} + \epsilon_i.$$

This can be written in the text, as  $\widehat{y}_i = \beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \beta_3 x_{1i} x_{2i} + \epsilon_i$  using as well.

When we need to show multiple steps, we can create a multi-line equation that is centered like this:

$$8(x-5) + x = 9(x-5) + 5$$
  
 $8x - 40 + x = 9x - 45 + 5$  (Distributing)  
 $9x - 40 = 9x - 40$  (Combining like terms)  
 $9x = 9x$  (Combining like terms)  
 $x = x$  (Dividing both sides by 9)

The equality holds for any x.

Note, I did a page break here so that the next section started on a clean page.

# 2.6 Running R Code

Code chunks can be entered into Sweave; e.g., here are some comments.

```
\begin{tabular}{ll} \# \ R \ code \ goes \ here \\ \# \ \textit{Output} \ is \ automatically \ printed \ in \ the \ pdf \end{tabular}
```

Below, you can see that we can do algebra with R.

```
8*(9-5)+9 #8(x-5)+x for x=9!
## [1] 41
```

Alternatively, we can produce the output without the code.

```
## [1] 41
```

We can also call objet values from R directly.

```
result <- 8*(9-5) + 9  # 8(x-5) + x for x = 9 result.with.error <- result + rnorm(1, mean = 0, sd = 0.1) result.with.error  ## [1] 40.99321
```

The result is 40.9932133. Note that I did not type the result, but I used the \Sexpr{} command.

# 2.7 Plotting

We can also plot with R.

```
#Plot a histogram of random exponential data
hist(rexp(100))
```

# Histogram of rexp(100)

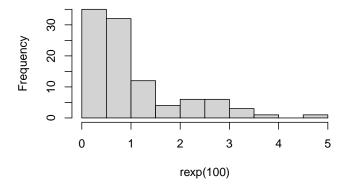

Figure 1: A histogram of random normally distributed data, n = 100.

#### 2.8 Tables

Below, we load and take a peek at some data about the death rates per 1000 in Virginia in 1940 (Molyneaux et al., 1947).

```
data(VADeaths)
head(VADeaths) # Take a peek of the data
##
         Rural Male Rural Female Urban Male Urban Female
                                        15.4
## 50-54
               11.7
                             8.7
## 55-59
                             11.7
                                        24.3
                                                      13.6
               18.1
## 60-64
               26.9
                             20.3
                                        37.0
                                                      19.3
## 65-69
               41.0
                             30.9
                                        54.6
                                                      35.1
## 70-74
               66.0
                             54.3
                                        71.1
                                                      50.0
```

If we want to print this nicely, we can do so using the xtable package (Dahl et al., 2019), which we can reference using the label (Table 1).

```
print(sleep.table,table.placement = "H", include.rowname=H
```

Rural Male	Rural Female	Urban Male	Urban Female
11.70	8.70	15.40	8.40
18.10	11.70	24.30	13.60
26.90	20.30	37.00	19.30
41.00	30.90	54.60	35.10
66.00	54.30	71.10	50.00

Table 1: Death Rates per 1000 in Virginia (1940).

# 3 Appendix

If you have anything extra, you can add it here in the appendix. This can include images or tables that don't work well in the two-page setup, code snippets you might want to share, etc.
